The Sacred Name

A COMPLETE DEEP DIVE

Naming, the Egyptian Ren, the Phonetics of the Divine Word, and the Modern Strawman Conspiracy

---

The Egyptians believed that to speak a being's true name was to call that being into presence — and that to erase a name from a monument was to end its existence more completely than death itself.

That belief never actually left. It is still standing behind every prayer that closes with a specific word, every mantra repeated to alter a state of mind, and every argument that your own legal name is not really you.

This is the deep dive into naming as sacred technology: the Ren of ancient Egypt, the letter-mysticism of Hebrew Kabbalah, the vibrational theology of Sanskrit mantra, the real and contested history of the word Amen, and the modern pseudolegal conspiracy that turned name magic into a courtroom argument.

A name was never just a label. The only real question has always been what, exactly, it does.

Introduction — What a Name Actually Does

Across an extraordinary range of unrelated cultures, a recurring conviction appears: that a name is not an arbitrary label attached to a person or a being after the fact, but a real, active part of that person or being — something with causal power in its own right. To know a true name is to have leverage over its owner. To speak a name is to summon a presence. To lose a name, or have it erased, is to suffer a kind of death more total than physical death. This document traces that conviction across its clearest historical sources — above all the ancient Egyptian doctrine of the Ren, but also Hebrew letter-mysticism, Sanskrit mantra theology, and Greek Logos philosophy — before turning to two of its most consequential living legacies: the ordinary Christian prayer formula "in Jesus's name, amen," and the modern pseudolegal "strawman" conspiracy theory, which repurposes ancient name-magic logic as a courtroom argument against the state.

The throughline connecting all of this material is a single claim, stated in as many vocabularies as there are traditions that hold it: sound and name are not neutral, descriptive add-ons to reality, but active, structuring forces within it. Whether that claim is best understood as literal metaphysics, as a psychologically real fact about human attention and intention, or as a compelling but unprovable inheritance from the ancient world is a question this document raises directly rather than settling by assertion — particularly in its treatment of the Amen/Amun question and the strawman theory, where popular claims and documented scholarly consensus diverge sharply.

The Ren — Egypt's Theology of the True Name

Ancient Egyptian religion held that a complete human being was composed of several distinct parts, one of which — the Ren — was the person's name itself, understood not as a convenient label but as a living, constitutive part of the soul. To know a being's true name was to hold real power over it; to speak a name aloud was to call that being into active presence; and the Ren, so long as it continued to be spoken, was believed to grant the named person a form of ongoing existence beyond physical death. Egyptian funerary practice reflects this directly: tomb inscriptions, offering formulas, and the Book of the Dead itself repeatedly instruct the living to speak the name of the deceased, precisely because doing so was understood as an act that materially sustained that person's continued being in the afterlife, not merely an act of memorial sentiment.

The logical inverse of this doctrine was damnatio memoriae — the deliberate erasure of a name from monuments, inscriptions, and king-lists — which ancient Egyptians treated not as a symbolic insult but as a targeted act of metaphysical annihilation, aimed at making the erased person's continued existence in the afterlife genuinely impossible. The most extensively documented case is Akhenaten, the pharaoh who imposed monotheistic worship of the Aten and was, after his death, subjected to systematic erasure by his successors (including Horemheb) so thorough that his name was omitted from official Egyptian king-lists for millennia and his existence became known to modern scholarship only through later archaeological rediscovery at Amarna; comparable, if less total, erasure campaigns were carried out against Hatshepsut's monuments after her death. This pattern makes Egypt one of history's clearest documented cases of a civilization treating the control of names — granting them, speaking them, and erasing them — as a genuine instrument of religious and political power, not merely a record-keeping convention.

Isis and the Secret Name of Ra

The clearest narrative statement of Egyptian name theology appears in the myth of Isis and the secret name of Ra, preserved in Egyptian magical papyri. Ra, the sun god and king of the gods, held ultimate power in part because his true, secret name was known to no other being — his public names and titles were many, but the private name that constituted his deepest identity and the true source of his authority remained hidden even from the other gods. Isis, already renowned as the most skilled magical practitioner among the Egyptian

pantheon, engineers a means of extracting it: she fashions a serpent from earth mixed with Ra's own saliva and places it in his path, and when the serpent's venom afflicts him with an illness none of the other gods can cure, Isis offers to heal him on the single condition that he reveal his true name to her directly.

Ra resists, offering a succession of his public names and titles instead, but the poison's pain eventually forces him to comply, and once Isis possesses his true name, she gains authority that even the king of the gods himself must respect. The myth is, among other things, ancient Egypt's own explicit theological argument for why naming and true-name knowledge functions as real spiritual power rather than as folklore alone: within Heliopolitan cosmology, the myth is presented as literally true, and it is cited directly in surviving Egyptian magical texts as the precedent authorizing the practice of invoking a deity's or a demon's true name in order to compel that being's action — the direct ritual ancestor of the theurgic and goetic name-invocation traditions that later spread through Hellenistic, Hermetic, and medieval European magical practice.

Hebrew Letter-Mysticism — Sefer Yetzirah and Gematria

A structurally similar but independently developed conviction runs through Jewish Kabbalistic tradition, most systematically in the Sefer Yetzirah ("Book of Formation"), a foundational Kabbalistic text of uncertain but ancient origin (traditional attribution to the patriarch Abraham; modern scholarship dates its earliest layers to somewhere between late antiquity and the early medieval period) that describes God creating the universe not through a single undifferentiated act but specifically through combinations of the twenty-two letters of the Hebrew alphabet, understood as the actual structural building blocks of created reality rather than as a human notational convenience invented after the fact. In this framework, the Hebrew language is not a language reality happens to be describable in; it is the specific code reality is built from, making Hebrew letter combination itself a form of genuinely creative, world-making activity — the same logic later Kabbalistic legend applies to the golem traditions, in which a properly assembled combination of Hebrew letters is believed capable of animating inert matter.

Gematria, the practice of assigning numerical values to Hebrew letters and then reading numerically equivalent words or phrases as meaningfully, theologically connected, extends this same conviction into an interpretive method still actively used in traditional and academic Jewish textual study today. The Tetragrammaton — the four-letter Hebrew name of God, YHWH — represents the tradition's most extreme and most carefully guarded expression of true-name theology: considered too sacred to pronounce as written, its actual historical pronunciation was deliberately allowed to fall out of common use and remains genuinely uncertain to modern scholarship, with the euphemistic substitutions Adonai ("my Lord") or HaShem ("the Name") used in its place in Jewish liturgical and everyday speech — a live, functioning example, distinct from ancient Egypt but structurally parallel to it, of a religious tradition treating a true divine name as too powerful, and too dangerous in careless use, to be spoken at all.

Sanskrit Vibration — Om, Nada Brahma, and Mantra

Hindu and broader Vedic tradition developed its own independent, richly elaborated theology of sacred sound, most concentrated in the concept of Om (or Aum), described across multiple Upanishads as the primordial vibrational sound underlying and preceding the creation of the material universe itself — not a word that refers to the divine from outside it, but the actual acoustic signature of ultimate reality (Brahman) becoming manifest. The closely related doctrine of Nada Brahma ("the world is sound," or "God is sound") generalizes this claim into a comprehensive cosmology in which all of manifest reality is understood as a form of continuously sounding vibration, with human speech, music, and mantra recitation understood as specific, deliberately shaped participations in

that underlying cosmic sound rather than as separate, merely symbolic human activities layered on top of a silent physical universe.

Mantra practice — the disciplined, often lengthy repetition of a specific sacred sound, syllable, or phrase, frequently a deity's name or an epithet of the divine, under a teacher's guidance — is the primary devotional technology built on this theology, and functions in Hindu, and by extension in Buddhist and Sikh, practice as something closer to a precisely calibrated spiritual instrument than to a prayer in the looser Western devotional sense: correct pronunciation, rhythm, and repetition count are frequently held to matter to the practice's effectiveness in ways directly comparable to the Ifugao mumbaki's insistence, documented elsewhere in this series, that a ceremony's technical correctness rather than the practitioner's sincerity alone determines whether it actually works. A 2026 neuroscience study specifically measuring brain activity during mantra recitation found genuinely divergent EEG alpha-wave patterns produced by different specific mantras, lending at least preliminary, peer-reviewed support to the traditional claim that the particular sound recited, not simply the act of focused repetition in general, measurably matters to the practice's effect on the practitioner's brain state — a finding worth distinguishing clearly from the unsupported Solfeggio-frequency claims addressed later in this document, since it concerns measured neurological correlation rather than an assertion about ancient tuning history or DNA repair.

A Mantra Ceremony — Japa, Step by Step

Japa, the formal practice of mantra repetition, follows a widely taught structure across Hindu, Buddhist, and Sikh contexts alike. A practitioner first selects or is given a specific mantra — often, in initiated practice, a personal mantra received directly from a guru and not disclosed to others — and settles into a steady, comfortable seated posture, since sustained physical stillness is considered a precondition for the mind's attention to settle onto sound rather than onto bodily distraction. A mala, a strand traditionally of 108 beads, is then used to count repetitions without requiring active numerical tracking by the conscious mind, freeing attention to rest on the mantra's sound and meaning rather than on counting itself; each bead is moved past the thumb with a single repetition of the mantra, continuing around the full mala (traditionally 108 repetitions) and, in more extended practice, through many further full rounds.

The repetition itself is typically practiced in one of three registers: aloud (vaikhari japa), in a whisper barely audible even to the practitioner (upanshu japa), or entirely mentally, with no vocalization at all (manasika japa, considered by many traditions the most advanced and most powerful form precisely because it requires no external phonetic support to sustain the vibration). A japa session typically closes with a period of silent sitting immediately after the final repetition, understood as allowing the sound's effect to continue reverberating and settling within the practitioner even after active recitation has stopped — a structural echo of the same logic behind the Ren's requirement of continued speaking to sustain a soul's ongoing presence, applied here to the practitioner's own inner state rather than to an external being's continued existence.

Logos — The Word as First Principle

Greek philosophy developed its own closely related but independently sourced doctrine in the concept of Logos, a term whose semantic range covers word, reason, discourse, and underlying rational principle simultaneously, and which pre-Socratic philosophers including Heraclitus (6th–5th century BCE) had already proposed as the rational structuring principle underlying an apparently chaotic cosmos, well before the term's most famous theological deployment. That deployment arrives in the opening of the Gospel of John ("In the beginning was the Word [Logos], and the Word was with God, and the Word was God"), which fuses Hellenistic Logos philosophy with Hebrew creation theology to identify Christ specifically with the same creative, ordering, world-generating linguistic principle that Genesis had already attributed to God's spoken commands ("Let there be light") and that Sefer Yetzirah would attribute to the Hebrew letters themselves.

This Logos doctrine gives the wider Christian tradition its own distinct, theologically load-bearing version of the claim examined throughout this document — that speech and naming are not neutral description but active, world-making force — and it is this same doctrinal current, rather than any direct historical borrowing from Egyptian Ren theology specifically, that most directly explains why the closing formula of Christian prayer places such theological weight on the specific phrase invoked at its end, discussed in detail below.

"In Jesus's Name" — Why Prayers Close the Way They Do

The common Christian prayer formula "in Jesus's name, amen" draws directly on New Testament passages (most explicitly John 14:13–14 and John 16:23–24) in which Jesus instructs his followers to ask the Father specifically "in my name," a phrase Christian theology has historically read not as a polite verbal formality but as an invocation of Christ's own authority and mediating role — praying "in Jesus's name" is understood, across most Christian traditions, as approaching God specifically through and by the authority of Christ's name rather than on the petitioner's own independent standing, making the phrase a live theological claim rather than a closing pleasantry, fully continuous with the wider true-name-as-power logic this document has traced from ancient Egypt through Hebrew and Sanskrit sacred-sound traditions.

The word that follows, amen, entered Christian liturgical use directly from Hebrew and Jewish synagogue practice — the New Testament authors, writing in Greek, transliterated the Hebrew term rather than translating it, and it was already a fixed congregational response in Hebrew scripture and Second Temple synagogue worship centuries before Christianity's emergence, used specifically to affirm and ratify a preceding statement, blessing, oath, or curse as true and binding. Its widespread adoption, essentially unchanged in form, across Christian, and later Islamic (as āmīn), liturgical practice makes it one of the most durable and most widely shared single words in continuous religious use across three major world religions.

The Amen/Amun Question — What the Evidence Actually Shows

A specific and widely circulated popular claim holds that the Christian and Jewish liturgical word amen derives from, or directly invokes, Amun (also rendered Amon or Amen), the ancient Egyptian god who rose to become the chief deity of the Egyptian state pantheon at Thebes — implying, on this reading, that every prayer closed with "amen" is unwittingly invoking an Egyptian deity's name. This claim is genuinely popular and worth documenting honestly and specifically, rather than either dismissing it as obviously absurd or repeating it as established fact, because doing either would fail this document's own standard of verifiable accuracy.

The documented linguistic and historical evidence does not support a derivation. Amen is a Hebrew and broader Northwest Semitic word built from the root ’-m-n (א-מ-ן), meaning firmness, certainty, faithfulness, or reliability — the same root that produces the Hebrew words emunah (faith) and ne'eman (faithful, reliable) — and its use as a fixed liturgical affirmation ("so be it," "it is true" or "it is certain") is attested in the Hebrew Bible in contexts (Numbers, Deuteronomy, the Psalms) that substantially predate any documented Israelite or Judean religious or linguistic dependency on Theban Amun-worship specifically, and it derives from ordinary Semitic vocabulary with a clear, independently documented meaning rather than from a borrowed foreign name. Mainstream Egyptological and Semitic-linguistics scholarship treats the phonetic resemblance between amen and Amun as very likely coincidental — a chance convergence of two unrelated words from two entirely different language families (Northwest Semitic and Egyptian) rather than as evidence of derivation, direct linguistic borrowing, or continuity, in exactly the same way that many phonetically similar words across unrelated language families turn out, on closer historical linguistic analysis, to share no actual etymological connection.

None of this makes the underlying question uninteresting, and this document does not dismiss the wider point that motivates it: Amun's rise as an Egyptian solar-associated supreme deity, and the possibility of broader ancient Near Eastern religious cross-pollination between Egypt, Canaan, and early Israel, is itself a real and actively studied area of scholarship, distinct from the specific amen/Amun etymological claim. What the evidence specifically does not support is the more precise, frequently repeated claim that the word amen itself is derived from or means to invoke Amun's name — a claim that remains popular chiefly because of the two words' surface phonetic resemblance, in a pattern of appealing but ultimately unsupported pattern-matching directly comparable to the golden-ratio-in-everything critique this series has already applied to the modern sacred-geometry movement.

Haligricity Convergence — Why This Practice Avoids the Word

The preceding section documents, on the evidence, that amen does not derive from Amun. Even so, correct phonetics matters as much as correct etymology — the same principle Sanskrit mantra practice insists on when it treats a mispronounced syllable as a functionally different, less effective sound rather than a harmless approximation. As a matter of Haligric practice specifically, this project treats the phonetic resemblance between amen and Amun as worth active attention regardless of its historical origin: the sound is close enough to the transliterated Amun/Amen spelling of the Theban god's name, and close enough on the ear to other words entirely, that continued casual use risks exactly the kind of unconsidered, habitual invocation this whole document argues real name-magic traditions took seriously and modern speakers mostly do not.

Rather than treat that resemblance as proof of derivation — which the evidence in the preceding section rejects — or dismiss it as irrelevant to a practice built on the premise that sound and name are active forces, Haligric practice takes a precautionary position: choosing a different closing word in prayer and ritual rather than amen. If sound and name carry the causal weight this document has documented across Egyptian, Hebrew, Sanskrit, and Christian tradition alike, then deliberately closing with an unambiguous word costs nothing and forecloses a risk that costs everything; if they do not carry that weight, the substitution costs nothing either way. This is stated plainly as a practice choice grounded in phonetic caution, not as a claim that the etymological question has been settled in the popular direction — the two are different questions, and keeping them separate here is what keeps this document's own evidentiary standard intact.

Solfeggio Frequencies and the Modern Sacred-Sound Movement

The contemporary wellness and sound-healing movement has produced its own popular extension of ancient name-and-sound theology in the "Solfeggio frequencies," a set of specific tones (396, 417, 528, 639, 741, and 852 Hz being the most commonly cited, with 528 Hz — marketed as the "love frequency" or "DNA repair frequency" — the most widely promoted) claimed by contemporary sound-healing practitioners to correspond to an ancient six-tone musical scale used in Gregorian chant and to carry specific measurable healing, emotional, or even genetic effects when listened to or used in meditation.

The claimed connection to authentic ancient Gregorian or biblical tuning is not supported by musicological or historical evidence: the specific 396–852 Hz frequency set in wide circulation today traces to a numerological method popularized in the 1970s by researcher Joseph Puleo, using a Pythagorean-style reduction applied to numbers derived from Bible verses, rather than to any documented ancient tuning standard, and specific claims such as 528 Hz's ability to "repair DNA" have no support in peer-reviewed genetics or biology research. This does not mean sound and music have no genuine, well-documented effects on mood, relaxation, and attention — that broader claim is well supported by mainstream psychoacoustic and music-therapy research — but the specific historical and biological claims attached to the Solfeggio frequency brand specifically are a modern invention layered onto, rather than a genuine continuation of, the ancient sacred-sound traditions documented earlier in this volume.

Numerology and the Name-Frequency Healing Movement

A more specific healing practice, built directly on the belief that a name carries a real vibrational signature, has developed in contemporary sound-healing circles. A practitioner asks a client for the name they currently use in daily life — rather than a birth name or a name no longer in active use, on the theory that the name presently in use is the one actively shaping the person's day-to-day state — and converts it into a number using one of two competing letter-to-number systems: Chaldean numerology, which assigns values based on each letter's claimed ancient vibrational value and is presented as a Babylonian-derived tradition, or Pythagorean numerology, a simpler sequential letter-to-number system attributed to the Greek mathematician. That number is then mapped onto a specific audible tone, producing a personalized recording the client is instructed to listen to regularly — commonly over about a month — with the stated goal of easing the nervous system or overall energy into better alignment.

The evidentiary caution applied throughout this document applies here as directly as anywhere in it. Numerology's letter-to-number systems have no established basis in linguistics, acoustics, or physiology, and the fact that Chaldean and Pythagorean numerology are two different, mutually incompatible conventions — capable of assigning the same name two different numbers depending on which system a given practitioner prefers — is itself a strong indicator that the numbers involved are a matter of interpretive convention rather than a discovered physical property of the name. Several commercial tools built on this practice lean specifically on frequency correlations attributed to Royal Raymond Rife, an early-twentieth-century American inventor whose claims of curing cancer with targeted electromagnetic frequencies were investigated and found unsupported, and which mainstream medical historians and cancer-research bodies now treat as a documented case of pseudoscience with no credible evidence behind it. Citing Rife's frequency work as a scientific basis for a modern name-tone product does not strengthen that product's evidentiary standing, whatever the sincerity of the practitioners offering it.

Tuning Forks and Biofield Tuning

Distinct from recorded Solfeggio tracks or numerology-derived name tones, physical tuning-fork therapy applies vibrating metal forks directly to or near the body, and one specific, widely known modern system — Biofield Tuning — was developed by sound therapist Eileen Day McKusick and described in detail in her book Tuning the Human Biofield: Healing with Vibrational Sound Therapy. The method holds that the body is surrounded by a measurable energetic field, the "biofield," that develops detectable areas of turbulence or distortion at points said to correspond to specific past physical or emotional experiences, and that a trained practitioner can locate these areas by sweeping a vibrating tuning fork through the space around the body, listening or feeling for a change in the fork's tone, and then working to resolve the distortion through continued application of specific tuning-fork frequencies at that location.

The evidence here sits in a genuinely different place than the flatly unsupported Rife and Solfeggio claims addressed above, and it is worth being precise about exactly where. Tuning forks themselves have a long-established, uncontested clinical use in conventional medicine for basic neurological and hearing assessment, and sound and music therapy more broadly is well supported by mainstream psychoacoustic research for measurable effects on mood, stress, and relaxation. Biofield Tuning specifically is much newer and much less studied: a small inter-rater agreement study published in a peer-reviewed journal in 2020 found that trained Biofield Tuning practitioners could locate similar points around a body with better-than-chance consistency, which establishes that practitioners are responding to something reproducible in their own practice, but does not by itself establish what that something is, whether it corresponds to any actual energetic field, or whether locating and treating it produces a health outcome beyond what focused attention and relaxation would produce on their own; a small number of separate pilot studies report reduced tension and pain scores after tuning-fork sessions, consistent with the broader, well-established evidence for relaxation-based interventions generally rather than with any confirmed biofield mechanism specifically. Medical and complementary-therapy researchers accordingly classify Biofield Tuning as an emerging, still largely unproven practice rather than an established treatment — a status its own leading practitioners generally acknowledge, positioning it explicitly as complementary to, rather than a replacement for, conventional medical care.

Key Figures and Texts

The Egyptian Book of the Dead (more accurately titled the Book of Coming Forth by Day), a collection of funerary spells compiled and copied over roughly two millennia, repeatedly instructs the deceased and the living alike in the correct speaking and preservation of the dead person's name, and includes specific spells intended to prevent a person's name from being forgotten or erased in the afterlife — treating the text itself as a working technical manual for sustaining the Ren rather than as devotional literature alone. The Egyptian execration texts, a distinct genre of ritual curse inscriptions (typically written on pottery bowls or figurines that were then ceremonially smashed) naming specific foreign rulers, rebellious officials, or hostile forces, represent the deliberately weaponized use of the same doctrine: naming an enemy in a properly conducted execration ritual was understood as a genuine, effective form of attack, distinct from ordinary cursing in that it relied specifically on the target's correctly identified name as the mechanism of harm.

The Sefer Yetzirah's traditional attribution to the patriarch Abraham is not treated as a historical claim by modern scholars, who instead read the text's earliest surviving layers as a product of late antique or early medieval Jewish mysticism, likely composed or compiled somewhere between the second and eighth centuries CE; regardless of its precise date and authorship, it became one of the two or three most influential texts in the entire subsequent history of Kabbalah, cited directly by later major Kabbalistic authorities including those responsible for the Zohar, the tradition's other foundational text. The Upanishads (composed roughly 800–200 BCE), specifically the Chandogya and Mandukya Upanishads,

are the primary textual sources for Om's theological status as the primordial sound of creation, and remain actively studied and cited within contemporary Hindu philosophical and devotional teaching on mantra practice.

Erasure While Still Living — A Second Kind of Damnatio Memoriae

The Ren section above documents Egypt's clearest erasure cases — Akhenaten and Hatshepsut — as posthumous campaigns, carried out against pharaohs who were already dead; recent scholarship (a 2025 study published in Antiquity) further clarifies that much of Hatshepsut's specific statue destruction was ritual "deactivation" consistent with standard treatment of royal statuary, layered under a genuinely political, but still posthumous, campaign against her name and image driven by her successor Thutmose III. But Egyptian evidence also documents name-erasure used as a weapon against people who were still alive, and it is worth being specific about both cases, since they show the doctrine working two different directions at once.

The clearest documented case comes from the trial records of the conspiracy that assassinated Ramesses III, preserved in the Judicial Papyrus of Turin and related trial papyri. Several convicted conspirators had their actual names formally struck from the official record and replaced with deliberately insulting substitute names before their sentencing and execution — a defendant whose name likely honored the god Amun, rendered something like Pebekamen ("Amun's servant"), appears in the surviving trial record instead as Pebekkamen ("the blind servant"); another, likely originally Mersure ("Ra loves him"), appears as Mesedsure ("Ra hates him"). These renamings were imposed on defendants who were still alive, on trial, and awaiting sentencing — a documented judicial technique built directly on Ren doctrine: because a name was held to carry constitutive power over its bearer's identity and fate, formally replacing a living defendant's true name with a cursed one functioned as a genuine part of the punishment, not a scribal joke, and was clearly intended to follow the condemned into whatever came after execution as well.

A second, very different case of living erasure comes from Akhenaten's own reign, and it connects directly back to this document's Amun material. Sometime after his fifth regnal year, Akhenaten ordered a systematic campaign to chisel the name and image of the god Amun — along with, in many cases, other traditional gods — out of temples and monuments across Egypt, not after Amun-worship had faded but while it remained the dominant state religion he was actively trying to displace in favor of the Aten. Read through the Ren framework this document has traced throughout, that campaign was a deliberate attempt to erase a name still fully alive and functioning, mid-worship, mid-institution — the reverse of the more familiar pattern of erasing a pharaoh only once safely dead, and a useful correction to any assumption that Egyptian name-erasure was exclusively a posthumous practice. The irony is worth stating plainly given this document's earlier findings: Akhenaten's campaign specifically targeted Amun, the same god modern popular claims mistakenly link to the word amen — and it is Akhenaten's own name, not Amun's, that later Egyptian king-lists would go on to erase after his death, restoring the very god he had spent his living reign trying to erase.

The Reuse of Names — Calling the Soul Line

If erasing a name was understood under the Ren doctrine as an act capable of ending a person's continued existence, the logical mirror of that belief is that reusing a name — giving a living descendant the name of someone who came before them — carries its own form of continuity. Egyptian religious texts are explicit that speaking a name sustains the Ren; they are less explicit about whether handing that same name to a new bearer counts as a second, ongoing form of that same sustenance, and this document does not overstate the historical record here — no surviving Egyptian text sets out a formal doctrine stating that naming a child after an ancestor extends that ancestor's Ren specifically. What the record does show clearly is that Egyptian names were rarely arbitrary: many carried theophoric

elements, a god's name built directly into the child's own, as in Amenhotep ("Amun is satisfied") or Ramesses ("born of Ra"), and were chosen as declarations of identity, destiny, and divine relationship rather than as neutral labels — the same underlying conviction this document has already traced from the Ren doctrine outward to Akan, Yoruba, Jewish, Aboriginal, and Hindu naming traditions in the section below.

Extending that conviction to the modern, largely secular practice of reusing a family name — a child named for a grandparent, a namesake carrying a parent's name forward, a name kept in continuous use across generations of the same line — is this document's own interpretive connection rather than an ancient Egyptian doctrine restated as settled fact, and it is offered here explicitly as that: a Haligric reading, not an Egyptological one. Read through the Ren framework, a reused name is not simply a sentimental gesture; it is, structurally, close to the same act the Book of the Dead instructs the living to perform at the offering table — speaking a name so that whatever it carries does not go silent — except performed continuously, every time the new bearer is addressed, across the length of an entire second lifetime. Whether or not a listener holds the underlying metaphysical claim to be literally true, the pattern is worth naming plainly: every time a name is passed forward within a family or lineage, something that functions like a soul line — an identity, a set of associations, a piece of a person who came before — is being called back into active, spoken presence, which is exactly the mechanism this document has been describing since its opening page.

Wider Cosmology — Naming Across World Traditions

The conviction that naming carries genuine spiritual weight recurs, in locally specific form, across a wide range of traditions beyond those given detailed treatment above. Among the Akan of Ghana and Ivory Coast, documented elsewhere in this series, every child traditionally receives a kradin ("soul name") corresponding to the day of the week on which they were born, understood as connecting the child to that day's specific guardian spirit (kra) and character; the formal outdooring ceremony at which this name is publicly announced, typically on the child's eighth day of life, is one of the most important rites of passage in Akan life. Yoruba tradition similarly holds that a child's name (particularly an oriki, a praise-name or lineage name) actively shapes the character and destiny of the one who carries it, making name selection a matter of active spiritual consequence rather than parental preference alone — a conviction with close structural parallels to the Egyptian Ren doctrine, developed entirely independently in West Africa.

In Jewish tradition, the bar and bat mitzvah ceremony marking religious adulthood centers the young person's formal Hebrew name, often used for the first time in a fully public liturgical role at that ceremony; in many Aboriginal Australian traditions, a secret or sacred personal name, distinct from an everyday public name, is held to carry the individual's deepest spiritual identity and is disclosed only to specific initiated community members; and Hindu naming ceremonies (namkaran) similarly involve consultation of astrological charts to select a name whose specific sound and meaning is understood to actively align the child with auspicious cosmic influences from the moment of naming forward. Taken together, this range of independently developed practices supports the claim, made at the start of this document, that treating names as active spiritual forces rather than neutral labels is one of the most widely and independently recurring convictions documented anywhere in comparative religion.

Self-Care, Wellness, and Naming Practice Today

Contemporary wellness and spiritual practice has adapted ancient name-and-sound theology into a range of everyday, individually practiced techniques: spoken affirmations (the deliberate, repeated speaking of a specific stated intention or self-description, on the theory that repeated speech actively shapes belief and outcome); adopted or chosen spiritual names taken on at initiation into a specific practice or community, intended to mark and reinforce a genuine change in identity or life direction; and the broader mantra

and chanting practices, drawn from the Sanskrit tradition documented above, now widely taught in secular yoga and meditation contexts with the explicit theological content often deliberately minimized or removed.

The ancestor-altar practice of speaking the names of the deceased, documented across multiple traditions in this series (the Egyptian Ren doctrine chief among them, but recurring independently in Zulu amadlozi practice, in Mexican Día de los Muertos observance, and elsewhere), remains one of the most widely and continuously practiced living applications of the belief that naming sustains a form of ongoing presence — practiced today by people who may hold no explicit metaphysical commitment to the Ren doctrine specifically, but who report, consistently across cultures, that the act of speaking a lost person's name aloud carries a felt weight that silence does not.

The Strawman Theory — Origins of the Modern Legal-Name Conspiracy

The modern "strawman" theory is a pseudolegal belief, most associated with the sovereign citizen movement in the United States and the closely related freeman-on-the-land movement in the United Kingdom, Canada, and Australia, holding that the government, at the moment of registering a birth certificate, creates a separate legal or corporate entity — typically rendered in the theory's own literature in all capital letters, e.g. JOHN SMITH, as distinct from the flesh-and-blood living man John Smith — and that this separate "strawman" entity, rather than the actual living person, is what is properly subject to taxation, court jurisdiction, and other government authority. Adherents typically claim that by correctly understanding and formally asserting this distinction (through specific filings, declarations, or ritual-like verbal formulas used in court), an individual can lawfully detach themselves from the strawman entity and thereby exempt themselves from taxes, debts, traffic laws, or criminal prosecution.

The theory's specific intellectual roots are most often traced to redemption-movement and Uniform Commercial Code (UCC) theories that circulated in American tax-protester circles from the 1970s and 1980s onward, themselves drawing loosely and inaccurately on genuine but unrelated areas of commercial and admiralty law, and it should be understood as a modern legal folk theory rather than as a documented continuation of ancient Egyptian, Hebrew, or any other historical name-magic tradition specifically — though it clearly draws, whether its adherents recognize this explicitly or not, on the same deep, cross-cultural intuition this document has traced throughout: that a name, correctly identified and correctly spoken or written, carries real power over the being or entity it names.

The Redemption Ritual — What Strawman Practice Actually Involves

Strawman and sovereign-citizen practice has developed its own body of specific, ritual-like procedures, most commonly: filing specific documents (frequently invoking the UCC, an "acceptance for value" notice, or a private trust or copyright claim over one's own legal name) with government offices, in the belief that doing so formally establishes the practitioner's separation from the strawman entity; adopting specific spoken or written formulas in court proceedings (declining to be identified by the all-capitals name, insisting on being addressed only as a specific lower-case or hyphenated variant of one's name, or reading a prepared declaration asserting one's status as a "free flesh-and-blood man" rather than a legal person) intended to prevent the court from establishing jurisdiction; and, in some documented cases, attempting to draw funds from a claimed government "treasury account" supposedly created in the strawman's name at birth, in order to pay off debts or fines.

Court records across the United States, United Kingdom, Canada, and Australia document that every one of these procedures has been consistently and explicitly rejected by every

court that has considered them, with judges in multiple jurisdictions describing strawman and related sovereign-citizen arguments in published rulings as having no basis in law and, in several specific cases, imposing additional sanctions, fines, or contempt findings on litigants who persisted in raising them after being warned. Practical consequences documented in news and legal reporting include defendants losing tax-evasion, foreclosure, and traffic cases they might otherwise have had legitimate defenses in, and, in some cases, facing separate fraud charges for attempting to draw on nonexistent government accounts. Law enforcement and judicial-training material in several jurisdictions now specifically flags strawman and sovereign-citizen filings as a recognizable pattern, both because of the practical burden repeated identical filings place on courts and because a documented minority of adherents have escalated to violent confrontation with police and court officials during enforcement actions, making the phenomenon a live subject of concern for judicial-security researchers as well as legal scholars.

Legacy and Influence

The conviction that names carry real force has left a continuous, traceable line of institutional and everyday influence: the Ren's insistence that speaking a name sustains a soul underlies practices from Egyptian funerary religion through the modern ancestor altar; Hebrew letter-mysticism's treatment of language as world-building substance underlies Kabbalistic study still actively practiced today; Sanskrit mantra theology underlies a global yoga and meditation industry that has substantially outgrown its country and religion of origin; and Logos theology underlies the specific theological weight Christian prayer places on its closing invocation, whatever the accuracy of any specific etymological claim layered onto that practice afterward.

The strawman theory represents a genuinely distinct, much more recent branch of this same underlying intuition, and its continued spread — despite uniform legal failure — is itself worth taking seriously as a sociological and psychological phenomenon: it suggests that the ancient conviction this document opened with, that correctly naming and correctly addressing a name grants real power, remains sufficiently persuasive at an intuitive level that people continue to construct new, modern versions of it even in a legal and administrative system that has explicitly and repeatedly rejected every one of its specific claims.

Controversies and Fairness

This document has already treated several of its most contested specific claims — the amen/Amun etymology, the Solfeggio frequency movement's historical claims, the Rife-derived frequency correlations used in some name-numerology practice, and the early and still-unsettled evidence behind Biofield Tuning — with the documented evidence held clearly against the popular or strongest version of each claim where the evidence warrants it, and that same standard applies most importantly to the strawman theory: this document presents it as a real, sociologically significant, and historically traceable belief system, not as a legally valid or historically well-grounded one. Every documented court ruling on the specific procedures described above has rejected them, and presenting the theory otherwise, or suggesting it offers a viable legal strategy, would be inaccurate and could cause real practical harm to anyone who acted on it.

A separate and genuine point of fairness concerns appropriation and boundary-crossing between traditions: Egyptian Ren theology, Hebrew Kabbalistic practice, and Sanskrit mantra tradition are each living or historically embedded religious systems belonging to specific communities, and the modern wellness movement's frequent practice of extracting isolated techniques (a mantra, a Hebrew letter, an Egyptian symbol) from their full theological and communal context, without engagement with the tradition's own practitioners or scholarship, is a documented point of concern raised by scholars and, in the case of living traditions, by practitioners within those communities themselves — a concern this document aims to avoid by presenting each tradition's naming theology within its own

specific historical and communal context rather than as an undifferentiated menu of interchangeable techniques. Finally, this document's own scope is necessarily selective: name-magic and sacred-naming traditions exist in comparable depth among the Chinese (the correct rectification of names, zhengming, as a Confucian ethical and political doctrine), across Islamic tradition (the Ninety-Nine Names of Allah and their recitation as a devotional practice, dhikr), and in dozens of other traditions documented elsewhere in this library, and their absence from detailed treatment here reflects a limit of length rather than a judgment that they matter less.

Closing

The Egyptian priest still speaks the dead man's name over the offering table, and somewhere the Ren answers.

The Kabbalist still turns the Hebrew letters over, looking for the specific combination the world was actually built from.

The mantra still moves around the mala, one bead at a time, whether or not anyone listening believes sound built the universe.

And the prayer still closes the way it has closed for two thousand years — not because a name from the Nile is hiding inside it, but because someone, a very long time ago, decided that the word you end on is the word that carries the rest of it home.
